## Refueling Control Valve

### Description

The refueling control valve shall function to reduce a higher upstream pressure to a constant, lower downstream pressure regardless of fluctuations in supply or demand. The valve shall be equipped with a two-way solenoid valve that will allow the valve to open when energized. The valve shall also be equipped with a high capacity surge control pilot to close the valve quickly in the event of sudden reduction in flow. The valve will also open automatically in the event of pressure reversal. The OCV 114-1E is a control valve specifically designed for aircraft refueling service. Known as either a refueling or a hydrant control valve, it performs the following functions:

- Opens and closes electrically via a solenoid pilot
- While open, modulates to control downstream pressure at a predetermined set point
- Closes rapidly to prevent undue pressure buildup due to a rapid reduction in demand

### Features & Benefits

- Electrical deadman control
- Pressure reducing pilot senses valve outlet or pressure compensating venturi
- High-capacity surge control minimizes pressure buildup on reduction of flow
- Opening speed control
- Automatically opens for downstream thermal relief or defueling
- Equipped with visual indicator to monitor valve position
- Can be maintained without removal from the line
- Factory tested and can be preset to your requirements

### Typical Applications

Commercial Airports

Military Bases

Bulk Fuel Storage Tanks

Truck On/Off Loading

### Certification & Compliance

NSF-ISO Quality System (9001)

FM Approved

Joint Certification Program

UFGS-33 52 43.14 Guide Specifications

CE (Conformité Européenne) Compliance

Fuel Farms

Hydrant Systems

Mobile Refueling Equipment (Carts/Trucks/Tankers)

Refineries

### Operation

The two-way, normally closed solenoid, wired into the deadman control system, closes the main valve when deenergized. Energizing the solenoid opens the valve and allows it to come under control of the pressure reducing pilot. The reducing pilot responds to changes in pressure and causes the main valve to do the same. The net result is a constant modulating action of the pilot and main valve to hold the downstream pressure constant. The pilot system is equipped with an opening speed control.

In the event of a sudden decrease in flow, downstream pressure will increase. The normally closed surge control pilot opens on the increased pressure, causing the main valve to move further closed at a much faster rate than would be accomplished through the normal control circuit. As a result, pressure buildup is minimized.

In the event downstream pressure becomes higher than upstream pressure, the valve will automatically open to provide thermal pressure relief or defueling flow.

### Components

The OCV 114-1E consists of the following components, arranged as shown on the schematic diagram:

- 1 Model 65 Basic Control Valve
- 2 Model 1340 Pressure Reducing Pilot
- 3 Model 451 Two-Way Solenoid Pilot, N.C.
- 4 Model 2470 or 1330 Surge Control Pilot
- 5 Model 126 Ejector
- 6 Model 141-3 Flow Control Valve (opening speed control)
- 7 Model 141-1 Check Valve
- 8 Model 123 Inline Strainer
- 9 Model 155 Visual Indicator

### Pressure Table

| End Connections                               | Ductile Iron | STEEL/SST | STEEL LCB | STEEL WCB | Aluminum |

The OCV 114-1E is normally sized to match the meter size; however, in no case should the maximum velocity exceed 20 ft/sec (metric: 6.10 meters/sec).

Resetting, maintenance and periodic testing instructions must be followed as described in detail in the applicable OCV IOM (Installation, Operation & Maintenance) Manual.

**Typical Materials**

| Part                          | Standard Material   |
|-------------------------------|---|
| Body/Bonnet                   | Ductile Iron (epoxy coated), Carbon Steel (epoxy coated), Stainless Steel, Aluminum |
| Seat Ring                     | Stainless Steel, Bronze   |
| Stem                          | Stainless Steel, Monel  |
| Spring                        | Stainless Steel   |
| Diaphragm                     | Buna-N, Viton (Nylon reinforced)  |
| Seat Disc                     | Buna-N, Viton   |
| Pilot                         | Stainless Steel, Bronze   |
| Other Pilot System Components | Stainless Steel, Bronze/Brass   |
| Tubing & Fittings             | Stainless Steel, Copper/Brass   |

### Engineering Specifications

The refueling control valve shall be a single-seated, line pressure operated, diaphragm actuated, pilot controlled valve. The valve shall seal by means of a corrosion-resistant seat and a resilient, rectangular seat disc. These, and other parts, shall be replaceable without removing the valve from the line. The stem of the main valve shall be guided top and bottom by integral bushings. Alignment of the body, bonnet and diaphragm assembly shall be by precision dowel pins. The diaphragm shall not be used as a seating surface, nor shall the pistons be used as an operating means. The pilot system shall be furnished complete and installed on the main valve. It shall include an opening speed control, an inline strainer, pilot check valves, a valve position indicator, and a solenoid valve. The

refueling control valve shall be operationally and hydrostatically tested prior to shipment. The main valve body and bonnet shall be ductile iron. All ferrous surfaces shall be coated with 4 mils of epoxy. The main valve seat ring shall be stainless steel. Elastomers (diaphragms, resilient seats and o-rings) shall be Buna-N. The control pilots, opening speed control, check valves, control line tubing, and fittings shall be stainless steel. The solenoid shall have an explosion-proof enclosure and be suitable on <voltage> (see Technical Data section). The refueling control valve shall be suitable for pressures of <X> to <X> psi (see Pressure Table) at flow rates up to <X> gpm (see Flow Chart). The refueling control valve shall be an OCV 114-1E, as manufactured by OCV, Tulsa, OK, USA.
