

In many liquid piping systems, it is vital that line pressure is maintained within relatively narrow limits. This is the function of the 108 Pressure Relief / Back Pressure Series of the OCV control valves. Installed in the main flow line, the standard Model 108-2 acts as a backpressure or pressure sustaining valve. In this configuration, the valve maintains a constant upstream pressure regardless of fluctuating downstream damand. When used in a hypass line

fluctuating downstream demand. When used in a bypass line, the same model will function as a relief valve, protecting the system against potentially damaging surges.

#### **SERIES FEATURES**

- Relief: Maintains a constant inlet pressure by relieving excess high pressure.
- Sustaining: Prevents pressure from dropping below a minimum.
- Inlet pressure is accurate over a wide range of flow.
- Inlet pressure is adjustable with a complete range of control springs.
- Quick opening with controlled closing.

#### **VALVE FEATURES**

- Operates automatically off line pressure.
- Heavy-duty, nylon-reinforced diaphragm.
- Rectangular-shaped, soft seat seal provides driptight Class VI closure.
- Diaphragm assembly Guided top and bottom.
- Throttling seat retainer for flow and pressure stability.
- Easily maintained without removal from the line.
- ► Replaceable seat ring.
- Alignment pins assure proper reassembly after maintenance.
- ► Valves are factory tested.
- Valves are serial numbered and registered to facilitate replacement parts and factory support.

#### **SURGE / RELIEF**

Protects system from overpressure by exhausting excess pressure. The valve may only have to operate intermittently to prevent pressure surges that might occur on pump start, pump stop, or sudden downstream valve closure.

## BYPASS PRESSURE CONTROL

Valve keeps pumping system at a constant pressure by bypassing back to source. Provides accurate pressure control when system

demand varies widely.

## BACK PRESSURE / SUSTAINING

Valve allows flow when inlet pressure is above the set-point thus preventing inlet pressure from falling too low. Prevents demand from "robbing" the source, or keeps pump "on its curve."

Global performance. Personal touch.

#### **VALVE OPERATION**

- Relief Valve Closed under normal operating pressures. Valve opens when pressure rises to the set point. Valve will close when system pressure drops below set point.
- Bypass Pressure Control Valve Ópens and modulates to maintain the required pressure.
- Báckpressure / Sustaining Valve- Ópen under normal conditions and closes as upstream pressure falls below set point.

The Model 108-2 consists of the following components, arranged as shown on the schematic diagram: **1.) Model 65 Basic Control Valve**, a hydraulically-operated, diaphragm-actuated, globe or angle valve which closes with an elastomer-on-metal seal.

2.) Model 1330 Pressure Relief Pilot, a two-way, normally-closed pilot valve which senses upstream pressure under its diaphragm and balances it against an adjustable spring load. An increase in upstream pressure tends to make the pilot open.

**3.) Model 126 Ejector,** a simple "tee" fitting with a fixed orifice in its inlet port. It provides the proper pressure to the diaphragm chamber of the main valve depending on the position of the pressure relief pilot.

**4.) Model 141-3 Flow Control Valve,** a needle-type valve which provides adjustable, restricted flow in one direction, and free flow in the opposite direction. On the 108-2, the flow control valve is connected as a **closing speed control**.

5.) Model 159 Y-Strainer (standard on water service valves) or Model 123 Inline Strainer (standard on fuel service valves). The strainer protects the pilot system from solid contaminants in the line fluid.

**6A / 6B.) Two Model 141-4 Ball Valves** (standard on water service valves, optional on fuel service valves), useful for isolating the pilot system for maintenance or troubleshooting.

**PILOT** 1330 2400

Accurate sensing of inlet pressure.

Simple, single adjustment.

>All parts replaceable while mounted on valve.

Rubber-to-metal seat for positive shut-off.

Large area diaphragm for quick, precise throttling.
 Visual indication of diaphragm condition.

▶ Bronze and stainless steel construction.

Pilot Materials Low-Lead Bronze Stainless Steel Spring Ranges 5-30, 20-80, 20-200, 100-300 psi

Pilot Materials Stainless Steel Spring Ranges 200-750 psi The Model 1330/2400 Pressure Sustaining Pilot controls the amount of pressure in the upper chamber of the Main valve(s). (Hence, the degree of opening or closing of the Main valve). The upstream pressure increases, the pilot begins to open, decreasing the amount of pressure in the upper chamber of the main valve allowing it to open a proportionate amount, in order to maintain a constant inlet pressure. As the upstream pressure decreases, the pilot begins to close, allowing the pressure in the upper chamber of the main valve to increase causing it to close. This is a constant modulating action compensating for any change in upstream pressure.

#### Global performance. Personal touch.

#### **SIZING CONSIDERATIONS**

For the most comprehensive procedure in sizing Series 108 control valves, it is best to use our ValveMaster software or the guidelines shown here in conjunction with the Performance Charts in the Engineering Section of the OCV catalog.

#### **SURGE RELIEF**

Size is determined by the amount of flow required to lower the inlet pressure. This relief flow can be difficult to determine, so a general guideline is to use 60% of the rated pump flow. The 108 Series valve is capable of intermittent flows up to 45 ft. per second. Relief valve sizes are typically 50-60% of the mainline size.

#### **PRESSURE SUSTAINING**

Sustaining valves are typically main line size. However, maximum velocity through the valve should not exceed 25 ft/sec.

Elow, obart for full part value

## **BYPASS PRESSURE CONTROL**

Bypass pressure control valves are sized based on maximum flow and pressure drop across the valve. The maximum flow through the valve is the pump flow at the desired set point (from the pump curve) minus the

minimum system flow. The pressure drop across the valve is the set point minus the pressure at the valve discharge (typically pump suction or storage tank head). Determine the valve's operating Cv using the maximum flow and pressure drop from the formula:

where

Qmax = maximum flow rate, gallons per minute
 DP = pressure drop, psi
 sg = liquid specific gravity (water = 1.00)

From the chart below, pick the smallest valve that has at least the Cv determined above, and where the velocity does not exceed 25 ft/sec.

FIUW CHAIL IU	i iuli port	Valve											
Valve Size	1 1/4	1 1/2	2	2 1/2	3	4	6	8	10	12	14	16	24
GLOBE Cv	23	27	47	68	120	200	450	760	1,250	1,940	2,200	2,850	6900
ANGLE Cv	30	35	65	87	160	270	550	1,000	1,600	2,400		4,000	
FLOW @ 25 ft/sec	115	160	260	375	575	1,000	2,250	3,900	6,125	8,750	10,600	13,750	31,250
FLOW @ 45 ft/sec	210	280	460	650	1,000	1,800	4,000	7,000	11,000	16,000	19,000	25,000	56,000

#### **CAVITATION CONCERNS**

Many surge relief, and some bypass pressure control valves are, by their application, subject to pressure differentials that may induce cavitation. When these conditions exist, it may be only on an intermittent basis, causing minimum concern for valve deterioration. This complex phenomenon cannot be predicted by charts, which index only inlet and outlet pressures. The easiest way to predict cavitation is to let us do the calculation.

Simply fax, e-mail or call us and we will provide a graphical analysis and a solution.

Provide us:

APPLICATION (e.g., surge relief, bypass pressure control) VALVE SIZE PRESSURE-INLET and OUTLET FLOW RANGE-Minimum and Maximum FLUID TYPE FLUID VAPOR PRESSURE (if other than water)

TOLL FREE 1.888.628.8258 • phone: (918)627.1942 • fax: (918)622.8916 • 7400 East 42nd Place, Tulsa, Oklahoma 74145 email: sales@controlvalves.com • website: www.controlvalves.com

By combining various control pilots, multiple valve functions can be performed on a single Series 108 Pressure Relief Valve. To find the combination function valve, select the desired features and then the model number.

This chart shows only a sample of those most often specified valves. Consult the factory for specific data on the model you selected.

Combination valves can often reduce or eliminate other equipment. Example: If the system requires a Back Pressure Valve and a Check Valve, the check feature can be added as a function of the Back Pressure, Model 108-3.

Feature	20	3.2 N	8 <sup>3</sup> , 6	8ª 10	8 <sup>34</sup> ,0	Stc. 1	S <sup>S</sup> Definition
Pressure Relief (bypass)	x	x	x	x	x	x	Limit system pressure to predetermined max.
Pressure Sustaining	x	x	x	x			Maintains minimum valve inlet pressure
Solenoid Shutoff			x	x			Opens and closes valve electrically
Check Feature		x		x			Closes valve on pressure reversal
UL / FM Approved (fire pump relief)					x		Underwriter laboratories listed / Factory Mutual approved
Air Release / Vacuum Breaker						x	Valve is open to relieve air / opens to prevent vacuum

HIGH PRESSURE / HP

When valve inlet pressure requires the model 2400 High Pressure Relief pilot, an HP is added to the end of the model number. Example: Standard model 108-2 (inlet ranges from 5 - 300 psi) Model 108-2HP (outlet ranges 200-750 psi)

Surge Anticipation refer to series 118

OCV Control Valves was founded more than 60 years ago with a vision and commitment to quality and reliability. From modest beginnings, the company has grown to be a global leader just a half century later. In fact, OCV Valves can be found in some capacity in nearly every country around the world from fire protection systems in Malaysia to aircraft fueling systems in Africa and from oil refineries in Russia to water supply systems in the USA and Canada. You will also find our valves in irrigation systems in Europe, South America and the Middle East.

The original foundation on which the company was built allows our team of professionals to not only provide the service required to be a worldwide supplier, but more importantly the opportunity to afford the personal touch necessary to be each of our customers' best partner. Simply stated, we take pride in all that we do.

Committed to the work they do, our employees average over 15 years of service. This wealth of knowledge allows us to provide quality engineering, expert support, exacting control and the know-how to create valves known for their long life.

Being ISO 9001 certified means we are committed to a quality assurance program. Our policy is to supply each customer with consistent quality products and ensure that the process is right every time. Our valves meet and exceed industry standards around the world. Including approvals by:

All valves are not created equal. OCV Control Valves proves that day in and day out. We stand behind our valves and are ready to serve your needs.

Check individual models for availability.

\*GROOVED END NOT AVAILABLE IN DN32

For maximum efficiency, the OCV control valve should be mounted in a piping system so that the valve bonnet (cover) is in the top position. Other positions are acceptable but may not allow the valve to function to its fullest and safest potential. In particular, please consult the factory before installing 8" and larger valves, or any valves with a limit switch, in positions other than described. Space should be taken into consideration when mounting valves and their pilot systems.

A routine inspection & maintenance program should be established and conducted yearly by a qualified technician. Consult our factory @ **1-888-628-8258** for parts and service.

#### How to order your valve

When Ordering please provide: Series Number - Valve size - Globe or Angle -Pressure Class - Screwed, Flanged, Grooved -Trim Material - Adjustment Range - Pilot Options - Special needs / or installation requirements.
