

OCV Model 30 PR\UL

Aquestia
Directing the Flow

Pressure Reducing & Pressure Relief Valves

General representation

Fire
Protection

Pressure Reducing Valve

Description

An automatic, pilot controlled, pressure reducing valve actuated by the pipeline pressure. The valve regulates to a steady, preset downstream pressure regardless of upstream pressure or flow rate fluctuations. In case of excessive downstream pressure, the valve closes drip tight.

Certification & Compliance

UL Listed under VLFT category

Lloyd's Register Approval

ANSI FCI 70-2 Class VI seat leakage class

Features & Benefits

- Simple field adjustable pressure setting; no special tools & no system downtime
- Superior design featuring low pressure losses at high flow rates
- Low lifelong maintenance costs due to unique frictionless internal trim design
- High flows & working pressures (PN25/375psi)
- Stable regulation from near zero flow to maximum design flow
- Regulates at low flow & high pressure differential without bypass or U/V port design
- Out of the box fully assembled & tested valves
- Extensive valve & trim materials selection & corrosion protection coating
- Stainless Steel seat as standard

Typical Applications

Pump & Water Tanks

Fire Suppression Systems

Petrochemical, Oil & Gas Installations

Tunnels

Power Generation, Transformer & Transmission Plants

Onshore/Offshore

Mining

Operation

The OCV 30 PR\UL is a pilot-controlled, pressure reducing valve, actuated by the pipeline pressure. The valve accurately regulates to a steady, preset downstream pressure, down to near-zero flow rates, regardless of upstream pressure fluctuations and valve size. In case of excessive downstream pressure, the valve closes drip tight. The valve's unique design eliminates the need for a special low-flow plug design (such as V or U-ports), or the installation of additional smaller-sized bypass valves.

The valve's low-friction internal trim design utilizes an LTP® (Linear Throttling Plug) guide and a preshaped reinforced diaphragm. The standard and simple single chamber valve allows easier assembly, improved longevity and reduces periodic inspections and maintenance. When required, maintenance is easily done onsite and in-line.

When planning operation and design, please consider the following:

- The valve should be suited to the maximum designed flow and allowed head loss.
- For added safety, installing a downstream pressure relief valve (30 PS\UL, 77 PS\UL, 44 PS\UL or 108FCA) is highly recommended.
- Large pressure differentials may cause cavitation damage. Consult OCV for unique solutions if such conditions are expected.

Closed Position

Regulating Position

Resetting, maintenance, and periodic testing instructions must be followed as described in detail in the applicable OCV IOM (Installation, Operation & Maintenance) Manual.

Components & Typical Materials

The OCV 30 PR\UL consists of the following components, arranged as shown on the schematic diagram below.

ID	Part	Standard Material	POG (1) Applications
1	Valve Body	See OCV 300 Engineering Data (2)	
2	Inline Strainer	Brass, Stainless Steel Screen	Stainless Steel 316
3	Pressure Gauge	Brass	Stainless Steel 316
4	Pressure Reducing Pilot	Brass, Stainless Steel 316 Seat	Stainless Steel 316
5	Position Indicator	Stainless Steel 316	Stainless Steel 316

(1) Petrochemical, Oil & Gas

(2) Refer to materials selection guidelines, Engineering Data - Materials: Ductile Iron A-536 65-45-12; Cast Steel A-216 WCB; Cast Steel A-352 LCB; Austenitic Stainless Steel A-351/CF8M; Super Duplex 2507; Nickel-Aluminum-Bronze B-148 UNS C95800

Typical Installation

The typical installation of the OCV 30 PR\UL is as shown:

- 1 Pressure Gauge
- 2 Isolation Valve
- 3 Strainer
- 4 OCV 30 PR\UL Pressure Reducing Valve
- 5 Recommended Models: OCV 44, 77, 30 or OCV 108FCA Pressure Relief Valves

Typical System Layout

Pressure Reducing Station Layout
Including Downstream Pressure
Relief Valve

Optional System Layout for Redundancy

Similar to the typical installation -
while providing extra redundancy &
zero downtime during inspection &
maintenance.

10" - 12" = 30-285psi	

Engineering Specifications

The pressure control valve shall contain a fabric reinforced rubber diaphragm, elastic & resilient through its entire surface without vulcanized radial discs. The seat shall be stainless steel and interchangeable. The valve shall maintain a constant predetermined downstream pressure regardless of upstream pressure or flow rate fluctuations. Maintenance, disassembly and reassembly of all the valve's components shall be made possible onsite and in-line, without the need to remove the valve from the line. The valve shall be fully trimmed, hydrostatically and operationally tested at the factory and set to a fixed pressure. Change of factory preset pressure setting

can always be performed in-line following simple IOM instructions, without special tools or system downtime. Standard material valves such as ductile iron and cast steel should be coated with high-built fusion-bonded epoxy (FBE). Naval quality/very high corrosivity protection grade conforming to EN12944 C5M is available upon request. Additional coatings and special materials are available upon request. The pressure control valve shall be an OCV 30 PR\UL, UL Listed under VLMT category, as manufactured by OCV, an Aquestia Ltd. brand, Tulsa, OK, USA.
