<u> ОСV</u> моdel 110-95

OCV:110-9S.TS.CAT.EN.04

Differential Control/Air Check Valves

Two-Stage Preset Valve

> Description

The two-stage preset valve shall open in one stage and close in two stages based on signals from the preset register. The OCV 110-9S is specifically designed for fuel loading systems and performs the following functions:

- Electrical opening and two-stage shutdown via preset register
- Air Eliminator Functions main valve goes closed when air is detected at the air eliminator head and will re-open when all air has been exhausted from the air eliminator. This prevents air from passing through a meter and causing inaccurate readings
- LPG/LNG Functions upstream pressure is held at a fixed value above vapor pressure to prevent flashing at the flowmeter

- Can be controlled by mechanical or electronic presets
- Adjustable flow setting for 2nd stage dwell
- Factory tested
- Junction box options are available, with explosion proof ratings
- Two-stage electronic opening options are available
- Class 1, Div 1 (standard), Class I Div 2 ATEX, IECEX (opt)

CV Model 110-95

Differential Control/Air Check Valves

Operation

The OCV 110-9S is an air block valve which opens to fill a reservoir and will limit passage of any compressible medium such as air or flashing liquefied gas that may cause inaccurate flowmeter readings. The air block functions are designed to override electronic preset functions.

1. For liquefied gas systems, the 1356 pilot senses differential pressure between upstream and a system vapor pressure source, thereby keeping upstream pressure a set value above vapor pressure. This prevents the upstream fluid from flashing, which would cause erroneous flowmeter readings.

2. For air eliminator systems under normal operation, the 1356 top sense has little or no pressure and the OCV 110-9S is wide open. When air is introduced into the system, the air eliminator will simultaneously evacuate air from the system and pressurize the 1356 top sense port. When the 1356 top port is pressurized, the valve will close. The valve will open to continue the filling process when enough air has been removed.

The OCV 110-9S is electronically opened and closed via a preset controller:

Opening, Full Flow - The Main valve (1) opens when the preset controller energizes solenoid (3) and the differential pilot (4) is opened. Needle valve (5) is adjusted for optimum opening and closing speed.

 HI output applies power and opens the N.C. solenoid, activating pressure air check functions.

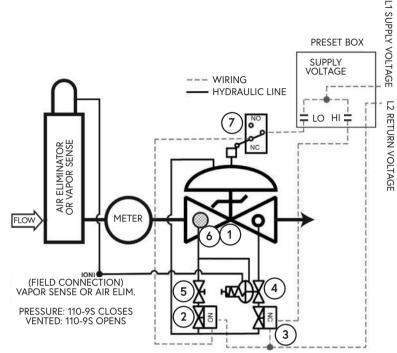

1st Stage Shutdown - Main valve begins closing a predetermined number of gallons before the end of the load.

- HI output removes power and closes the N.C. solenoid. HI output remains off through load.
- LO output sends power to the limit switch. The N.O. solenoid remains open (de-energized because limit switch contact is open.

Low (Dwell) Flow – Main valve closes far enough to trip the limit switch contact and holds this position for low flow filling.

 LO output sends power through limit switch contact and closes the N.O solenoid. This hydraulically locks the valve into a low flow position.

Final Closure - Main valve will close fully when the load is complete. LO output removes power from limit switch and N.O. solenoid. The N.O. solenoid opens and allows the main valve to close fully.

Components

The OCV 110-9S consists of the following components, arranged as shown on the schematic diagram:

- 1 Model 65 Basic Valve (fail closed)
- 2 Two-Way Solenoid Pilot, (N.O.)
- 3 Two-Way Solenoid Pilot, (N.C.)
- 4 1356 Differential Pressure Pilot
- 5 Needle Valve (closing speed)
- 6 Inline Strainer
- 7 Limit Switch (low flow setting)

Engineering Specifications

The two-stage preset valve shall be a single-seated, line pressure operated, diaphragm actuated, pilot controlled globe valve. The valve shall seal by means of a corrosion-resistant seat and a resilient, rectangular seat disc. These, and other parts, shall be replaceable without removing the valve from the line. The stem of the main valve shall be guided top and bottom by integral bushings. Alignment of the body, bonnet and diaphragm assembly shall be by precision dowel pins. The diaphragm shall not be used as a seating surface, nor shall the pistons be used as an operating means. The pilot system shall be furnished complete, installed on the main valve and include two solenoid pilots, a needle valve and an inline strainer. The twostage preset valve shall be operationally and hydrostatically tested prior to shipment. The main valve body and bonnet shall be ductile iron. All ferrous surfaces shall be coated with 4 mils of epoxy. The main valve seat ring shall be stainless steel. Elastomers (diaphragms, resilient seats and o-rings) shall be Buna-N. Solenoid pilots shall be stainless steel, as shall the needle valve and control line tubing. The solenoid and limit switch enclosures shall be explosion proof and suitable for operation on <voltage> (see Technical Data section). The two-stage preset valve shall be suitable for operation at <X> psi (see Pressure Table) at flow rates up to <X> gpm (see Flow Chart). The two-stage preset valve shall be an OCV 110-9S, as manufactured by OCV, Tulsa, OK, USA.
